

UNAVCO testing of the SCIGN radome (2001)

312 Beth Bartel March 24, 2010 [GNSS Antenna and Dome Test Reports](#), [Testing](#) 2031

SCIGN Dome Testing

The purpose of this test was to see the affects on station coordinates when a SCIGN radome is placed on a choke ring antenna. This report presents results from a test that was conducted at the UNAVCO facility in Boulder Colorado.

Experiment Description for UNAVCO's test of SCIGN Radome

Data was collected for 5 days, 24 hours a day. Two sets of receivers were run concurrently. See Figure 1 below. Each pair of receivers were run through a single splitter that was connected to a Trimble choke ring antenna (defined by the IGS to be TRM29659.00). Each set of receivers were run in a similar zero baseline configuration.

Processing Strategies

All data were quality checked and edited using [teqc](#), and processed using the Bernese GPS Software version 4.2. The data were processed as 24 hour files. Results from each of the following strategies will be looked at:

- For 5 deg, 10 deg, and 15 deg elevation cutoff
- L1 Phase Resolve Ambiguities
- L1 Phase Resolve Ambiguities + Trop
- L2 Phase Resolve Ambiguities
- L2 Phase Resolve Ambiguities + Trop
- L3 Phase Use L1 and L2
- L3 Phase Use L1 and L2 + Trop

Results for this test

The results of UNAVCO's SCIGN dome testing indicate sub-centimeter offsets, with a largest vertical offset of 5.65 mm +/- 1.21 mm for the Trimble 4000 SSI receiver pair at a 15 degree elevation cutoff. The largest North offset observed was 1.45 mm +/- 0.52 mm in L3 with troposphere parameters

estimated and a 5 degree elevation angle cutoff for the Trimble 4000 SSI receiver pair. The largest East offset observed was 1.24 mm +/- 0.33 mm in L3 with troposphere parameters estimated, for the Trimble 4700 receiver pair at a 5 degree elevation angle cutoff. After presentation of preliminary results to certain members of the UNAVCO community, it was determined that future work needs to take place in this area. Future work includes re-processing the data with some of the following parameters: fixed reference station ~ 300 km away using the double difference baseline strategy with the L3 (LC) observable, ambiguity resolution using the "QIF" strategy, zenith tropospheric delay: - stochastic, hourly, and piecewise constant, no apriori troposphere model, "Dry Niell" troposphere mapping function, and solid earth tide models. Along with other parameters not mentioned here.
