GNEX Software (JPL)

JPL's "GPS Network" tool for Linux, the GNEX software tool, was designed to operate with the TurboRogue GPS receivers and some meteorological data collection equipment. The primary operation of the program is downloading TurboRogue receivers, specifically the SNR-8000, SNR-8100, and ACT. GNEX supports direct connections through the RS-232 serial port or by a phone modem dial-up connection. GNEX is driven by a "task list," with additional supporting files which provide site access and configuration information. GNEX is available in Perl for Linux OS computers.
